The use of a bespoke, integrated, energy-efficient furniture design - incorporating Localised Air Filtration and Personal Control - permitted minimum use of cooling in an otherwise high IT usage building. The new personalised approach to air movement and filtration negated the need to increase the air-conditioning for the additional technology saving significant capital cost and running costs.

Additionally, the space planning and furniture design created a 20% improvement in overall occupational densities. This was achieved whilst creating an uncluttered, vibrant and spacious working environment that has been acclaimed by Staff, Managers and Visitors alike.
